## Panzer viii maus war thunder

The Panzerkampfwagen VIII Maus was a super-heavy German tank completed at the end of 1944. Only a full tank was ever produced. It weighed in 188 tons, making it the heaviest fully closed combat vehicle ever built. Armor: The main reason to play Maus is the armor, so I'll start there. The front armor of the hull is 200mm thick, but is inclined to where the effectiveness varies from 280-300mm. Combine this with a little angling, and this armor becomes everything, but impervible to conventional weapons that pierce ammunition. The front turret has 220mm armor, tilted to a semicircle. And here is the only frontal weakness on the tub. The curved nature of the armor leads to an area where the effective thickness is only 220mm. This is not enough to stop most laps at 7.7, so it must be angled at any time except when you shoot. The sides and the back of the turret and the hull are 200mm and 180mm respectively, so even if a reservoir wanders, they may have difficulty penetrating. But this armor, while impressive on paper, does not preform as great in play. In an uptier loses all its power, and even when it is the upper level you run into problems. Robe as Object 120 can merge right even if your armor, making this tank often exciting to play. Gun: The 128 mm KwK44 cannon is a shot to play and preforms extremely well at its level. The armour-piercing stock features 264mm penetration at 100mm, which is perfectly at 7.7 This round also containsgrams of explosive filler, making it a monster with one shot. The updated round only has a couple of millimeters of extra penetration, so I would concentrate your research elsewhere. This gun has a second charge long enough 18.2 with a blinded crew, so you need to choose your goal carefully. The tank also has a 75 mm coaxial cannon, which has a high explosive anti-tank shell with 80mm penetration. This is very useful against both slightly armored obstacles and tanks, especially enemy SPAA. Mobility: Abysmal. The tank has a maximum speed of 22km/h, which, in one word, sucks. Another problem with this mobility is the crossing; to turn the tank even a little it is necessary almost completely stop the vehicle. The reverse is surprisingly decent, beating many of the British reverse speeds. But by the way, you'll find yourself waiting in this tank. How to play: I would not recommend driving the Maus on large maps. It only takes too long to enter the battle, and you can go the whole game without seeing a single enemy tank. On maps of the city, I recommend you find a beautiful road of high activity and claim it as your own. Angle between shots and choose the enemy one by one. Final thoughts: The Maus is a tough but rewarding tank. 9 out of 10 games, you get invaded, or you are too late to kill anything, or you are bombarded. But that game in which everything goes well is as fun as you get. So, if you're the patient type, I suggest you take a look at the Maus. Page 2 (A12)matilda it was one of the first infantry tanks, produced for the first time in 1936. Almost 3000 were made and was mainly used by the british expeditionary force (bef) mainly in the battle of France (1940) and North Africa. In France, they were problematic for the Germans, most of their ineffective cannons against the heavy matilda armor. However, heavy losses were overcome in the battle of arras of successful counterattack. all vehicles were subsequently abandoned as the dunkirk evacuated bef. from 1940 to 1942, the matilda was mostly used by the 7th royal tank regiment and played a great role in the northern Africa deserts, destroying absolutely the tanks and the Italian enemy tankettes (see operation compass.) on the other hand, suffered losses to the cannons 88 cm of afrika korps. However, they were vital in breaking from tobruk and catching the fortress in bardy, were also used in other parts of the war; the urns that uses them received from the Land-Lease program, they served in peace, but were not adapted for the war of the island. is the most known variant is the tank of flail mine, the scorpion matilda. Even those captured by the Germans were well informed. the matilda fought through the African countryside, but with the second battle of el alamein, they were mostly replaced by churchill and san valentino. Finally, it was time for this old tank to rest. prosmuch as in real life, this old reservoir holds its ground in war thunder. thick 75mm armor cover its front andand is angled. The turret is small but rotates and shoots fast. For its caliber, the silhouette of this tank is small, which helps it to remain hidden. Despite his armor and turret, his 2-pounder QF gun gives him no advantage. Penetrating only 80mm with Shot Mk.1 AP/T shells, it is also almost impossible to destroy enemies at long intervals with the terrible accuracy of the weapon (even if the enemy cannot pierce through the armor at those distances). Besides, it's slow. A maximum speed of 25 kph and unwired controls will not help you to dodge bullets. And against most of his opponents, he will almost always be overcome.— This tank is a survivor, but only if you keep a clear head and know how to use it. There are some things to do with this war machine. Stay away from narrow and neighboring places where the enemy could engulf you, like woods and unknown rocks. That said, never enter the city. Any opponent tank will be to advantage there. The best way to play this tank is to stay behind the rows and provide cover fire for your team or defend catch goals. Place yourself in a place with cover, camouflage and good visibility of the area around you, like a hill or a sand dune. Bush and branches will help. Also, be careful to destroyers. These tanks have the power to penetrate the armor from the distance, so be careful. And that's all. I want the best with you and this old grinder of a car. car.
