Unsourced material may be challenged and removed.It also competes against another CA source code management tool, Panvalet.Standard source control functions are supported for element control including ADD, UPDATE, DELETE, MOVE, TRANSFER, SIGNIN and SIGNOUT.Many functions executed in interactive mode are completed in batch mode. All Endeavor element functions are described using a proprietary Software Control Language.The ADD function invokes a generate processor which then executes all actions required to register or update the element metadata and process outputs.

Generally, the result of issuing an ADD function is that the element will be registered to the target Endeavor stage, or the element registration will be updated in the target stage and the appropriate generate processor will be invoked. The TRANSFER function is used to bypass predefined lifecycles. In most cases, an element is stored internally by Endeavor as the code base with subsequent changes stored as deltas. As such, control of source happens internally to Endeavor and source control actions are separate from changes to objects in the output libraries which includes load modules and copies of processed code. The Endeavor application executes system actions using two dedicated system accounts for which have the access to write to Endeavor controlled libraries. As a general rule general mainframe users are prohibited from modifying Endeavor controlled libraries. This ensures that the only way to generate and promote code is via Endeavor and provides an audit trail of all changes. As Endeavor provides an interface for creating, modifying, moving, deleting and transferring elements via predefined lifecycles there is no need for any end user to have alter or update access to libraries controlled by Endeavor.

<https://formations.fondationmironroyer.com/en/node/8303>

This ensures that an audit trail is maintained for all actions and that the resulting objects controlled by Endeavor can be trusted. Two options are available for package security native Endeavor security or Endeavor External Security Interface ESI. A package is a container for Endeavor SCL and associated control information for code release. At a minimum a package has a name, an execution window defined the time range for when the package can be executed, notes about the package, various flags and at least one value SCL statement. Each security group specifies a list of users authorised to act for that group with a set quorum per group. This allows for defined systems development lifecycle stages to have set approvers and controlled releases. This is due to the security model within Endeavor for which requires explicit security access. This means that if the internal Endeavor system userid is not linked into one of the approver groups when a package is cast then the Endeavor batch system can not execute commands against that package. The default configuration for Endeavor approver groups is that no one specific approver in an approver group is mandatory. Generally, an approver group will have a quorum of 1, meaning that at least one of the users listed in the approver group needs to approve the package in order for the package to progress to the APPROVED status. An approver group quorum of zero is used for approver groups where the users either need to be informed of package actions or users require the ability to DENY a package but are not explicitly required to approve. Where an approver group with a quorum of zero is attached to a package the approval state is automatically set to APPROVED for that group. Which approver groups are linked to a package is based on the approver group rules.

As a general rule, when package control is used for an Endeavor stage then every Endeavor system will have at least one approver group for that stage and the approver group would have a quorum of zero. This means for every system referenced in the package there will be at least one approval required. These changes are only applicable to the package being cast and are not permanent changes to approver group configuration. Generally, there is one security table per Endeavor environment, however a single security table can be referenced by multiple environments. These tables are where the access for Endeavor functions is defined when using native security. This security table defines the access control lists defined by groups for which users are assigned to and lists the stages for which users can interact with. This controls the ability for users to execute specific SCM functions such as ADD, UPDATE, DELETE, MOVE. A security table can be defined per Endeavor environment to provide granular control for element actions down to per user if required. There are several exit types, each attached to a specific Endeavor function. An exit will specify where in the exit tree that the code will be executed and what will be affected. As an example, an exit could fail the generate action where the CCID is invalid. In particular, exits are used to deny end users from executing actions which would subvert the integrity of the system development life cycle process. Every type has at least one processor defined for which lists the name of the processor that performs the action required. The default system processor executes a standard copy, move or delete action. Processors can use both Endeavor symbols and Endeavor variables. Endeavor systems are defined by a specific symbol table which is essentially a list of name pair values. The default process moves the element BASE, DELTA and SOURCE OUTPUT LIBRARY objects from the source libraries to the target libraries as defined by the element TYPE.

<http://gerrim.com/images/breas-vivo-30-manual.pdf>

Every element is distinguished by the element name, system, subsystem and type. The type definition determines how the element is stored and how subsequent changes, known as deltas, are handled. In this example the type is COBOL in the TEST environment. The system uses these values to determine the source and target locations. As a general rule, one version of Endeavor is installed and used per LPAR. Developers can code in RDz IDE and seamlessly interface with Endeavor their codes. Click here for details. Systems with names in italics are no longer maintained or have planned endoflife dates. By using this site, you agree to the Terms of Use and Privacy Policy. I want to learn the Code Manmagement using it. Could you please provide me the link of Study Material for the same Manasi I did not attempt to register so have not gained further access to their documentation from this site. CA Guides and Tutorials to our LAN. The documentation is extensive and takes some patience to navigate. There is no one true way. Once you understand the basics of SCM then learn how Endeavor implements SCM and how your shop has configured Endeavor. Your system administrators should have a map of the defined Endeavor environments for your SDLC showing DEV TEST PROD etc. Much of what you really need to actually use Endeavor will be dependant on how Endeavor is customised at your shop. Your local Endeavor administrators should have documentation to get help you started and visualise the system configuration. Your local system documentation will show you how to access Endeavor via ISPF and submit Endeavor batch jobs. Go to SDSF and view the JCL of Endeavor jobs to learn what Endeavor is doing when elements are added, updated, deleted, moved, checked in, checked out, etc. Please be sure to answer the question. Provide details and share your research. Making statements based on opinion; back them up with references or personal experience. To learn more, see our tips on writing great answers.

Browse other questions tagged mainframe endeavor or ask your own question. Change Control Usage Procedures overview of Change Control Introduction Change Control is responsible for the promotion and Control of elements being put into production for both the Batch and OnLine processing done at the data center. 4 This includes the following elements Jobcards, Procs, Cardlibs, Suppdata Runbooks, Programs, Includes and Copybooks, which are moved from the quality assurance staging environment to the production environment. The purpose of this document is to explain how to do a Change Control request. Standards and Procedures Change Control Usage Procedures Page Objectives of Change Control This User Guide is meant to convey how the different

types of changes are put into the Change Control process; provide a how to which follows established procedure for doing Turnovers to the production environment. Audience This User Guide is for any employee who wishes to migrate elements from the development to the production environment. 6 This manual assumes the reader is familiar with the mainframe environment facilities, such as TSO, ISPF, etc. The Manual consists of two parts Part I Systems Management and Controls Procedure Manuals Part II Usage Procedures Manual The creation and maintenance Procedures are covered in the Maintaining Usage Procedures Manuals section of Part II. It consists of an INQUIRIES section and a REQUEST FUNCTION section. Select option 12. Enter an OnLine request. 5. 8 You are now at the first of four panels used to put in an Online Turnover request; the ONLINE TURNOVER INITIAL REQUEST PANEL; do the following A Fill in the 3 required fields 1. Application name 2. Description 3. Request Impact B Select option 4. Online Application 6. The second panel, the ONLINE TURNOVER REQUEST ENTRY PANEL, requires the following A There are 21 possible fields to use; fill in the 3 required fields and any other fields that support your request.

ophirtonhotel.co.za/wp-content/plugins/formcraft/file-upload/server/content/files/1626f1553d48da---bosch-she58c06uc-manual.pdf

Freeform text Standards and Procedures Change Control Usage Procedures Page 7. The third panel, the FREEFORM TEXT ENTRY PANEL, requires the following A There are 7 possible selections; fill in the 1 required field and any others that support your request. Request ready for management approval. ready to submit for Change Control 12. Cancel request before management approval. cancel all inputs and do not submit To complete the process, Select option 11. Request ready for management approval Standards and Procedures Change Control Usage Procedures Page Creating a Batch Turnover Request The topics described in this section refer to migrating elements of batch jobs into the production environment. Show more. We'll make the change to the element from within Endeavor, then we will create an Endeavor package to hold that change and move it through different stages. First we create a package In this example we'll not use a release, but instead just promote the changeset all the way to production using a Clarive pipeline. Explorer for Endeavor allows you to create customized filters for Endeavor Elements enabling you to Browse and Retrieve specific Elements, without knowing the exact path to navigate beforehand. Let us know on our Git repository Feel free to contribute right here. If you already have a CA Endeavor plugin Zowe CLI profile, you can access inventory locations immediately through your profile in the tree. If you do not have a profile, you can create one in Explorer for Endeavor. This allows you to view and explore the selected Endeavor repositories. You can create multiple profiles if necessary. Adding your credentials to your profile lets you access different configurations without entering your credentials. If you do not add credentials to your profile, a credential prompt displays whenever you click on an Endeavor configuration in the tree. You can also use this profile in Zowe CLI directly. To do so, click on the trash can icon on the same line as the profile name.

The profile automatically populates in the terminal panel. This step can be repeated as many times as you need to add multiple configurations. Once you log in, the stored filters are available for use. This allows you to determine if you want to retrieve and work with the Element If you wish, you can now Retrieve the Element, with or without Dependencies. Filters are saved automatically and so the list might become hard to manage. If you have any requirements or dependencies, add a section describing those and how to install and configure them. As these filters are derived from the properties of the specified element, they can be used, with wildcards, to identify other elements with similar characteristics. You can create a filter directly by specifying each parameter, or by searching Map View, and saving the path as a custom filter. The Delete filter action helps to keep your list of created filters manageable. The Element is stored locally while you work with it, and you can then apply your changes. The Element and components are stored locally in the specified

Workspace. The Elements are stored locally in the specified Workspace. Changes you elect to make to your operating environment could detrimentally affect the performance of Broadcom CA software and Broadcom shall not be responsible for these effects or any resulting degradation in performance of the Broadcom CA software. Severity 1 cases must be opened via telephone and elevations of lower severity incidents to Severity 1 status must be requested via telephone. Panvalet may be used to This is a readonly interface which During Server initialization, If this API At most sites, PANVALET is installed as an MVS In order to automate this language The first entry defines a default The following Some customers may have This user exit is required because security is not available via RACF, and a proprietary Panvalet exit PSPILXIT is only available under TSO dialogs. A sample exit and test harness is provided within the.

CNTL file shipped with the MFA product libraries Any other return code results in access being denied. This means that the MFAPVXIT can create a directory filter based on the access rights of the individual or his department. The algorithm is entirely up to the site, and will be based on table driven data compiled into the exit. The sample exit demonstrates how naming conventions, or tables of authorized users can be used to accomplish this. Individual source modules Multiple master files may be defined and This is a readonly During Server Access to this utility In some cases, a customer If this is the case, the new The user exit may be common, or may be assigned to a specific master file. If specified in the JCL, MFA builds a memory table to specify the Output Exit to be used for the given master file. Through the use of Exits and Processor Groups, it is Endeavor also has several optional This interface permits full function access to During Server This is necessary because the control structures If no C1DEFLTS table is found, then ENDEVOR support will That is, an object Access to the Endeavor interface This may require For those sites employing this feature, A subsequent promotion to Access security remains a SITE responsibility. This is Mainframe Access This is a special purpose address space that It is serially assigned to whatever thread is in need of The sample SERVERS member contains a definition for an This value can be increased if the demands of Review the sample JCL member MFAAS and If you use Processor Groups to compile and. Endeavor procedures to allocate compile and link output files. Region.

If you do modify the C1DEFLTS Your Endeavor Failure to provide a Mainframe Access Server implements the The parameters are also documented in Separating the processing from the MFA Server Review the startup parameter You customize and add this JCL to a system Some features of the MFAAS You can also customize any of several specialized ChangeMan DD If you omit this parameter the address space group name defaults to CALL. The default is NO. When enabled for group builds, MFA modifies the build options for each member of the AMB group to match the component name The default You should set an alternate qualifier if your installations SERNET does not have RACF authority to read or write data into During ChangeMan request processing, MFA Server loads and branch enters this module. Valid The default is SERXMLAC.SERXMLBC is intended for use in a batch job stream The MFAAS JCL sample provides sample DD statements for XMLIN and XMLOUT; however, they are commented Valid values are any single alphabetic or numeric character. The character specified is appended to The default is. NO. When enabled, SERNET logs information in XML format into the standard SERPRINT DD file. This file can be used to identify problems and to validate MFA services. Enabling. XML trace is not recommended for production systems due to the large volume of log data generated. MFA reads the XML file you specify, using only the options defined These options enable MFA to properly check out and stage ChangeMan components. See your Serena documentation for. ZDD Build Options for more information. This not only identifies which When you specify the same parameter for both the control and dependent startup regions, their values must If you update sample JCL in the MFA Server samples data set, be sure to copy it to the system procedure library. This support is Builder Generation process. Jive Software Version 2016. Gilera Ice Service Manual.

This means if a processor step uses a previously allocated DD statement such as SYSPROC, it is allocated for the processor step and subsequently deallocated at processor step termination. With the exception of packages and parallel development, all the functions supported on the CA Endeavor Quick Edit panel are supported by the EclipseBased UI, including browse and filtering.

At you can access the following resources Online and telephone contact information for technical assistance and customer services Information about user communities and forums Product and documentation downloads CA Support policies and guidelines Other helpful resources appropriate for your product Providing Feedback About Product Documentation If you have comments or questions about CA Technologies product documentation, you can send a message to To provide feedback about CA Technologies product documentation, complete our short customer survey which is available on the CA Support website at The Eclipse Foundations Eclipse SDK must be installed on each client computer where the EclipseBased UI is to be installed. The EclipseBased UI has been certified with release through of the Eclipse Foundations Eclipse SDK. Note The EclipseBased UI can be installed on platforms that support the Eclipse SDK version you are using. The Eclipse SDK includes the Eclipse Platform, Java development tools, and Plugin Development Environment, which contains source code, user documentation, and development documentation. Eclipse does not include a Java Runtime Environment JRE. For the proper version of the JRE or Java Development Kit JDK that must be installed on your machine to run Eclipse, go to Chapter 1 Installation 11. This procedure installs the EclipseBased UI on your client computer from the update site. This bin file contains the EclipseBased UI update site. The EclipseBased UI is installed on client computers using the Eclipse Update Manager, a feature provided by Eclipse. The Eclipse Update Manager is a builtin plugin installation and update manager that simplifies the installation process and lets you manage various plugin instances. Note For details on managing your configuration, see the Eclipse help. To install the EclipseBased UI for use with Eclipse releases through In Eclipse, select Help, Install New Software. The installation wizard opens. 2. Click Add.

The Add Site dialog opens. 3. Complete the following fields and then click OK. In the Name field, specify the name of the update site. In the Location field, enter one of the following URLs and then click OK. Enter the URL depending on which protocol your web server is using. This default URL points to the CA update site for the CA Endeavor SCM EclipseBased UI. The new CA Endeavor SCM EclipseBased UI update site is added to the list of available software sites, and is automatically scanned for possible updates, which are listed in the Installation wizard. 4. Select the check box next to EclipseBased UI, and click Next to proceed with installation of the EclipseBased UI. a. When prompted to confirm the installation, click Finish. b. When prompted to restart Eclipse, click Yes. The EclipseBased UI is installed on the client computer. Then, users can access this file to install the EclipseBased UI. Endusers can install the EclipseBased UI from the local archive file from the

Eclipse environment. 2. To install the Eclipsebased UI, complete the steps in the section Install the EclipseBased UI on a Client Computer see page 12 with the following exception In step 3, instead of setting the update site URL, click the Local or Archive button and navigate to location of the downloaded archived update site. Use the Archive button, if you are selecting the zip file. Use the Local button, if the archived update site was decompressed. Then, follow rest of the instructions in the section Install the EclipseBased UI on a Client Computer. Edit Proxy Definitions for Network Connectivity To enable Eclipse IDE to connect to the Internet and pass through a proxy server, you need to edit the Eclipse proxy definitions. The Active Provider settings specify the profile to be used when opening connections and has the following options The Direct option for Active Provider causes all the connections to be opened without the use of a proxy server.
